# Estimating the rates and modes of creation of new genetic variation in plants using NGS technologies

14/06/2016

Supervisor: Prof. Michele Morgante

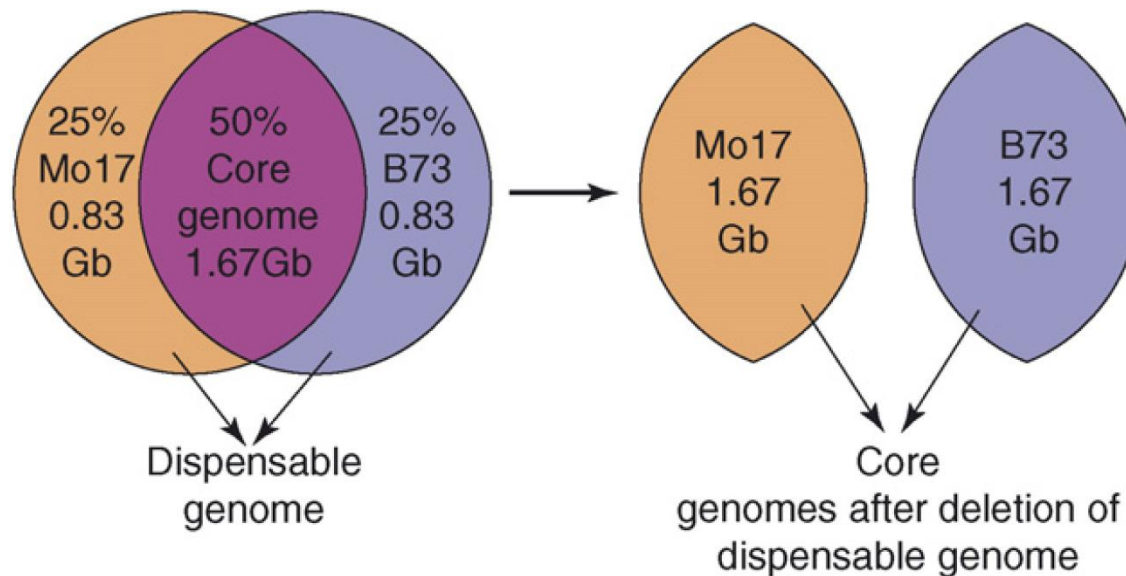

PhD Student: Ettore Zapparoli

Co-supervisor: Fabio Marroni

# The maize pan-genome

- A single individual genome is not representative of an entire species
- Pan-genome: the set of all genomic features among individuals within a species

# Aim of the project

## *Characterizing maize dispensable genome*

# Structural variants in plants

- **Deletions and insertions of TEs**

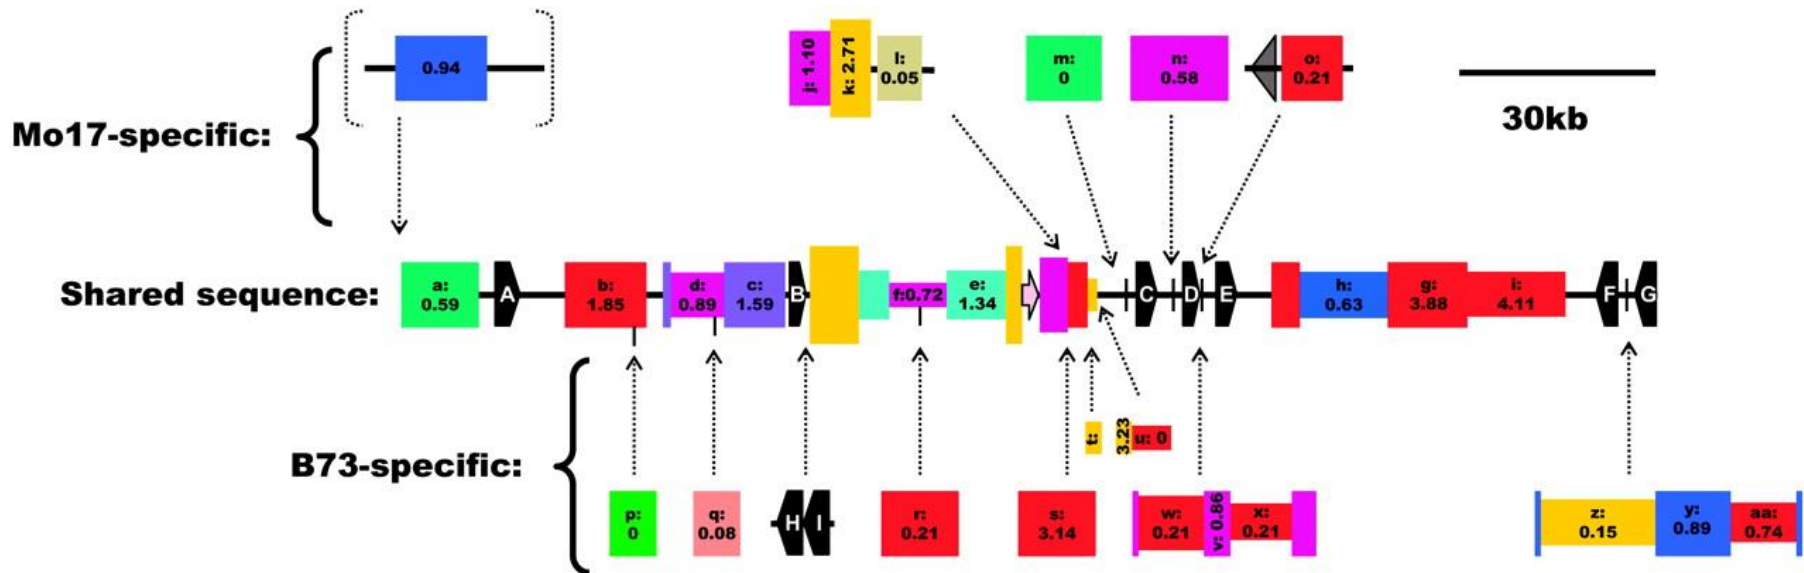

- **CNV: Copy-Number Variants**

- **PAV: Presence-Absence Variants**

# Insertions and deletions in maize

**Genes:** A) – I): geneA9008 – geneI9008

## Repetitive elements:

### 1) Transposon:

### 2) Retrotransposons:

<i>ji</i>	<i>cinful</i>	<i>tekay</i>
<i>opie</i>	<i>flip</i>	<i>zeon</i>
<i>reiver</i>	<i>prem</i>	<i>shadowspawn</i>
	<i>huck</i>	<i>non-LTR</i>

# CNV in maize

## Aluminum tolerance in maize is associated with higher *MATE1* gene copy number

# PAV in maize

## ► *Short arm Chr 6*

## ► *2 Mb present in B73 and absent in Mo17*

# PAV in maize

## ► *Short arm Chr 6*

# Structural variants discovery

## 1. Discovering **deletions**

## 2. Discovering **insertions**

## 3. Discovering **CNVs**

# Structural variants discovery

## 1. Discovering **deletions** (< 50 kbp)

- **Applying** available methods  
(*paired-end mapping*)

# Structural variants discovery

## 2. Discovering **insertions** (< 50 kbp)

- **Applying** available methods  
(*paired-end mapping*)
- **Developing** new methods  
(*split-reads mapping*)

# Structural variants discovery

## 3. Discovering **CNVs** (> 50 Kbp)

→ **Applying** available methods

*(depth of coverage approach)*

# Validation of detected deletions

- Integrated pipeline (*Magris, 2016*) calling:
  - Delly (*Rausch et al., Bioinformatics 2012*)
  - GASV (*Sindi et al., Bioinformatics 2009*)
- Validation in maize:
  - BAC sequences (Mo17; >1 Mb analyzed, 33 events)
  - genome assembly drafts (H99, HP301; 53 715 events)

Precision	Sensitivity	F1 score
0.92	0.66	0.77

# Validation of detected insertions

- TE DB-dependent methods
  - IGA internal pipeline (*Pinosio, 2012*) - PEM, De Novo assembly
  - Jitterbug (*Hénaff et al., BMC Genomics 2015*)
  - RetroSeq (*Keane et al., Bioinformatics 2012*)
- Validation in maize:
  - BAC sequences (Mo17; >1 Mb analyzed, 21 events)
  - genome assembly drafts (in progress)
- Preliminary analysis on BACs reveals an overall good power ( $F1 > 0.8$ )

# Developing Walle

- Developing a TE DB independent method: Walle
  - Split-reads mapping approach
  - Able to find insertions of not annotated elements
- Validation in vitis (now running in maize):
  - Simulation of 1000 insertions
  - Outperformed direct competitors

# Validation of Walle

# Walle methods

*Split-reads mapping approach*

## Normal alignment (no insertion events)

Sample   
Reference 

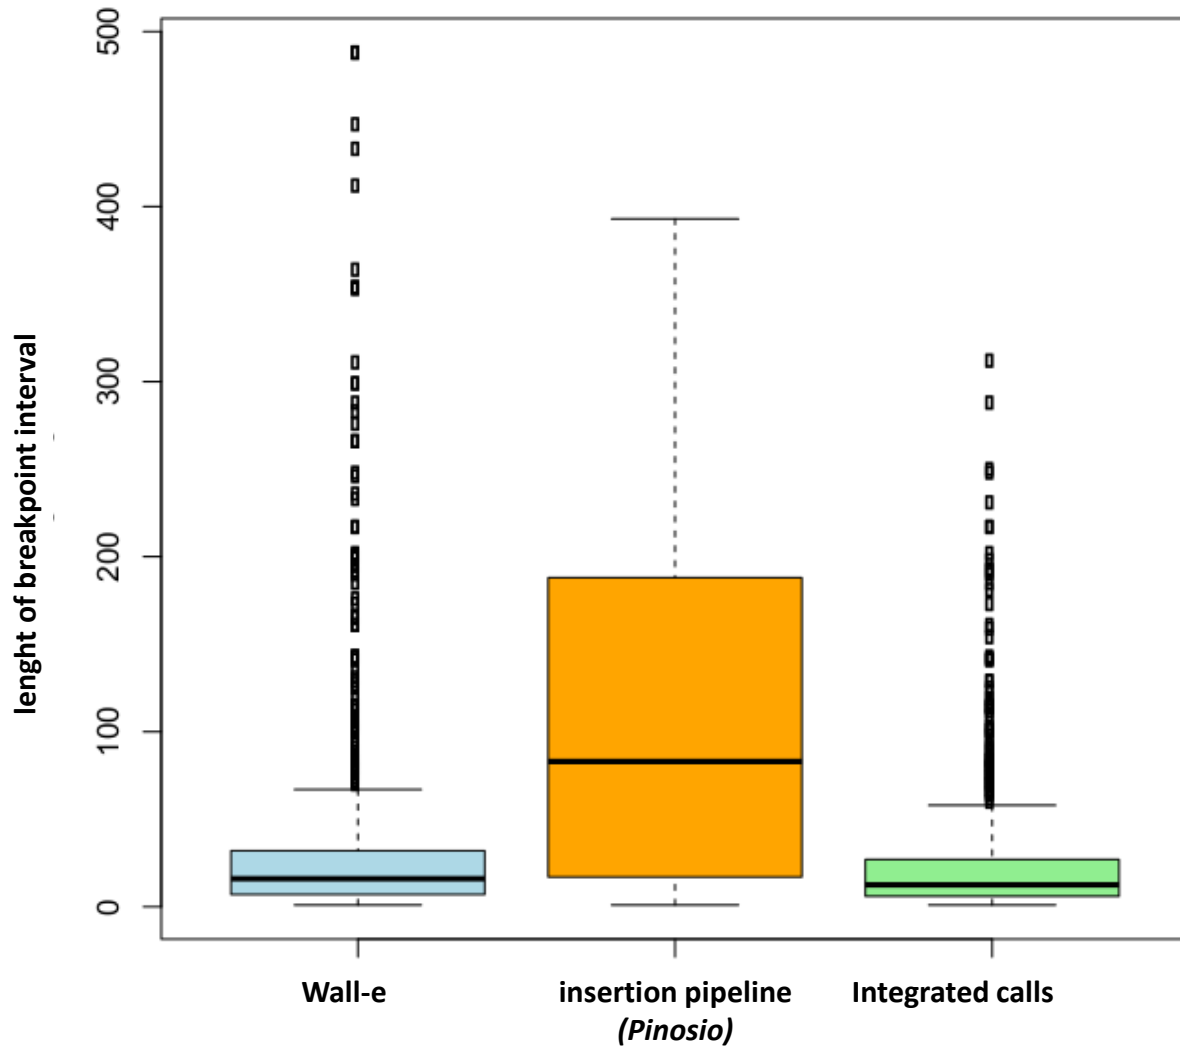

# Walle methods

*Split-reads mapping approach*

# Refinement of IGA internal tool calls

# Deletions in maize

# Insertions in maize

# Size of deletions and insertions

# Maize pan-genome

Gb

 Core genome	 Dispensable genome	 Insertions	 Deletions
---	--	--	---

# Shared genes analysis

- Analysis performed on 7 varieties (included B73)
- **PanViz** *D3 based visualization for comparative genomics*  
(<https://github.com/thomasp85/PanViz> - Pedersen TL, 2016)

# Discovering CNV

- Computing the ratio between the read counts of a sample genome and a reference genome in a region

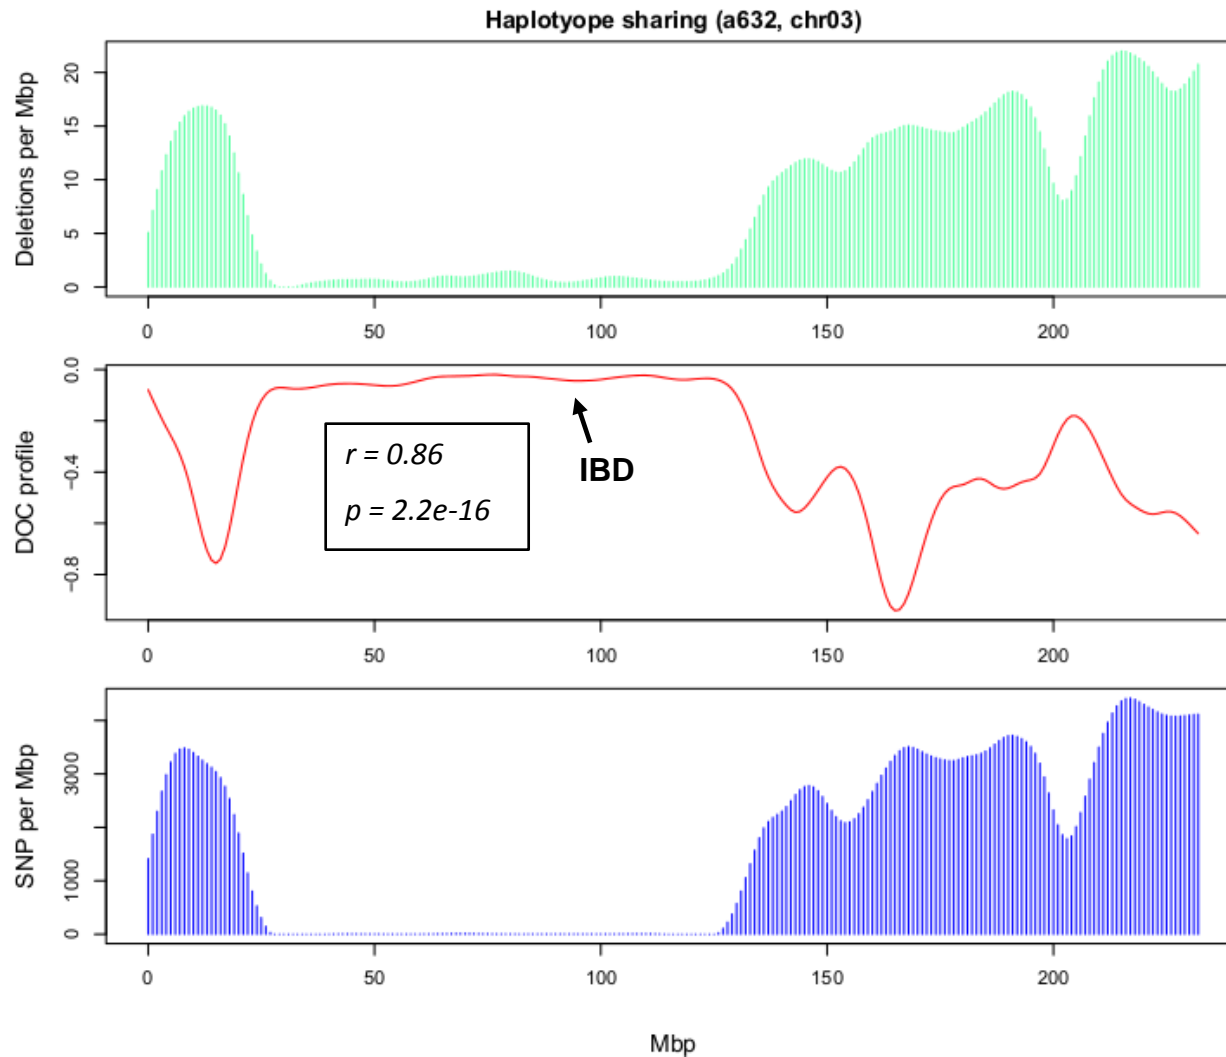

*(Baker 2012)*

# DOC profiles

A632/B73 chr03 profile

# Correlating deletions and DOC

# Future perspectives

- Insertions validation and genotyping
  - » Finalize Walle and validate it in maize
- Obtaining a list of CNVs in maize
- Complete the characterization of maize dispensable genome
  - » Obtaining a list of involved genes
  - » Identifying TE classes more often involved in SV
  - » Dating of amplification events of LTR sequences
